

The Robinhood Affair

The time was August 18, 2014. It was a Monday morning in my mom's Southeast apartment. I was lacking earlier in tributary coding

skills and regular coding skills, period, and I also had a summer reading assignment that could have been due the Friday of the week of 2014. The only

way to recover from the grade problems was to make a word processor for the people and my self that I could use to make my work and make it count.

Little did I know that it helped me get a 19 out of 20 and a historic grade point average – the highest GPA I ever had in high school in the first

advisory. The period that you are about to witness through reading this is known as the Robinhood Affair.

The first day of was hectic , involving coming late to school and realizing that things have changed without even knowing it. The

PDFLint word processor was planned carefully over the next two week to where the word processor works. I was overjoyed when it worked as that

was something that showed my full potential , which transformed my view of myself. The next thing that happened was that I stopped using it

PDFLint often to where it almost became a thing of the past, and a new kind of software was forged from the glorious ashes of PDFLint: SilverTick.

The SilverTick Task Viewer sparked up a movement that transformed the way that I created software for school and the size of my

software - The SilverTick-PDFL Bundle grew to an OS. The OS then grew and grew and grew to where it was by thanksgiving available on one

computer in the Phoenix Lab. Then came Thanksgiving Break, with Disqus, and so much more options to use for the OS and the new software that

came with it.

The months went by and I gave the students a large sum of resources made by and produced unintentionally by ArcherSys OS that created a new

path towards the new year , which is now. These events transformed me and the school as they created a better world for all in terms of code.
